PARAG KUMAR GOYAL

+91 9602563128 | 1997parag.goyal@gmail.com | linkedin.com/in/parag-k-goyal | github.com/paraggoyal28

TECHNICAL SKILLS

Languages & Core Foundations:	Java, SQL, JavaScript, HTML, CSS, DSA
Frameworks & Messaging:	Spring Boot, Hibernate, Java EE, Micronaut, REST APIs, GraphQL, Apache Kafka, RabbitMQ
Tools & Databases:	RAG, Vector DB, LLM, Amazon S3, Docker, OpenSearch, Git, Maven, JUnit, Selenium, Linux & Shell Scripting

PROFESSIONAL EXPERIENCE

Senior Application Software Engineer | Oracle

Sep 2024 – Oct 2026

- Designed and delivered a highly scalable, distributed Micronaut and Java-based REST API engine using Oracle on-premise vector database for OHAI charting-service, rendering and persisting questionnaires, questionnaire-responses, element definitions securely.
- Engineered a robust multi-threaded backend API handling 100 concurrent requests in parallel that recursively processes nested data structures as independent entities, seamlessly merging them to assemble high-integrity final object payloads.
- Developed automated metadata ingestion and normalization pipelines processing 12GB data volumes efficiently using batch processing by writing and optimizing PySpark scripts that uses LLM to generate similar keywords.
- Optimized charting efficiency by integrating automatic value population and cross-form lookup capabilities for previously answered clinical questions.
- Migrated complex database query operations to Oracle ATP, boosting response times by 20% across 15+ core feature API endpoints through structural path indexing, token-based pagination, and parameterized SQL query optimization.
- Authored core architectural specifications, mentored 4 junior engineers on the key charting workflows like save, sign.
- Integrated automated end-to-end Selenium tests directly into the CI/CD pipeline to safeguard rigorous production stability.
- Actively resolved critical production bugs and supported seamless deployments to ensure high application availability and operational resilience.

Software Engineer | Brane Enterprises

Mar 2023 – Sep 2024

- Designed a resilient, low-code integration framework to manage high-throughput inbound and outbound data traffic across JDBC, FHIR, and other adapter systems without persistent disk overhead of client data.
- Created a multi-tenant wrapper service on top of Amazon S3 managing secure, durable file persistence and high-throughput document management under strict on-premise security policies.
- Collaborated with cross-functional Agile teams of 5 engineers to schedule appointments for doctors and for patients to change and book appointments.

Software Development Engineer | Amazon *Aug 2021 – Mar 2023*

- Designed and safely deployed the feature for improving consumer experience for Feature Disqualified products across multi-region production environments through standard canary deployments.
- Designed alternative options to improve customer experience for recommendation widget displayed on top of Feature Disqualified products.
- Resolved a critical production deployment bug regarding variant user allocation anomalies where cumulative allocations failed validation, successfully unblocking the deployment pipeline.
- Awarded the Amazon Best Performance Award twice for exceptional delivery within short timelines.
- Volunteered as the team's Code Quality expert to champion clean coding standards, and collaborated with the team to come up with proper coding standards for better code quality.

Specialist Programmer | Infosys *Aug 2019 – Aug 2021*

- Developed a high-throughput server that ingested, validated, processed, transformed, and then persisted the clients defined data using RabbitMQ into secure production database environments.
- Automated manual operational workflows by engineering custom XML schema processor that parsed the XML file having a fixed schema and images, using asynchronous background CRON task, drastically reducing processing time and enabling concurrent background execution while preserving system responsiveness.

PROJECTS

Library Management System: Developed a comprehensive library management web application leveraging Java EE (JSPs, Servlets) for efficient inventory tracking, book issuance, and user account management.

SemanticStream: Built a semantic data stream processing architecture utilizing RAG models and vector databases to enable context-aware real-time information retrieval and analysis.

EDUCATION

B.Tech. in Electronics & Communication — MNIT Jaipur *2015 – 2019*
